

A Data Profile of Young Dual Language Learners in Virginia and Implications for Early Childhood Programs

AUGUST 2025

BY KATHERINE HABBEN AND VICTORIA KIM

Dual Language Learners (DLLs) are young children who have at least one parent who speaks a language other than English at home,¹ meaning when they enroll in English-speaking preschool, kindergarten, or other early childhood programs, their brains are using multiple language systems that are developing at different rates.² Research shows that to effectively support DLLs' early learning trajectories, the design of these programs must be responsive to their particular cognitive, socioemotional, and language development needs.³ In Virginia, there are 149,000 young children ages 0 to 5 who are DLLs, comprising 27 percent of all children in this age group. This large population is extremely diverse, bringing language skills and cultural assets among other important strengths to their schools and communities. As described below, these children are also disproportionately likely to face multiple risk factors that make them important targets for preschool and other early childhood services.

DLLs and their families benefit from access to high-quality early childhood programs and services, such as early childhood education and care (ECEC), home visiting, and infant and early childhood mental health services.⁴ These programs can support the early language development, future academic success, and long-term health and well-being of DLLs, while also providing integration-related supports for their parents, such as help navigating potentially unfamiliar early childhood, health, and social service systems. However, data show that children who live in households where a language other than English is spoken by a parent or primary caregiver have more limited access to early childhood services than peers in households where only English is spoken, despite making up a significant portion of the target populations that early childhood services aim to support.⁵

This fact sheet highlights key characteristics of Virginia's DLL children and the households in which they reside, underscoring both their diversity and certain factors that may hinder their access to early childhood services. These characteristics should be considered in the design and implementation of early childhood services to ensure they are equipped to support the well-being and future success of all children and their families. This information is based on Migration Policy Institute (MPI) analysis of data from the U.S. Census Bureau's American Community Survey (ACS) for the 2019–23 period, pooled.

BOX 1 Explore DLL Data

This fact sheet is part of a series of fact sheets on key characteristics of Dual Language Learner (DLL) children and their households nationwide and in the 30 states with the most DLLs. These fact sheets are available on the Migration Policy Institute website at: www.migrationpolicy.org/research/data-profile-dual-language-learners.

Additional data on DLLs ages 0–5 and 0–8, across the United States and in all 50 states, are also available at: www.migrationpolicy.org/programs/data-hub/charts/us-state-profiles-young-dlls.

Language barriers likely keep the families of many DLLs from accessing early childhood services on their behalf.

- ▶ Of the 149,000 DLL children ages 0 to 5 living in Virginia in 2019–23, 42 percent had at least one Limited English Proficient (LEP) parent, meaning the parent reported speaking English less than “very well” in the ACS (either “well,” “not well,” or “not at all”).
- ▶ In 2019–23, 17 percent of the state’s DLLs lived in linguistically isolated households, which the U.S. Census Bureau defines as households in which all members who are age 14 or older speak a non-English language and speak English less than “very well.”⁶
- ▶ LEP parents may find it difficult to identify and enroll their children in early childhood programs and may face challenges in communicating with program staff members.⁷
- ▶ DLLs in Virginia come from families that speak a wide range of languages. In 2019–23, 44 percent of DLLs lived in households that reported speaking Spanish, with the other 56 percent living in households reporting speaking languages other than English or Spanish, including but not limited to Arabic, Amharic and other Ethiopian languages, Urdu, and Chinese (see Figure 1).

FIGURE 1
Top Non-English Languages Spoken in DLLs’ Households in Virginia, 2019–23

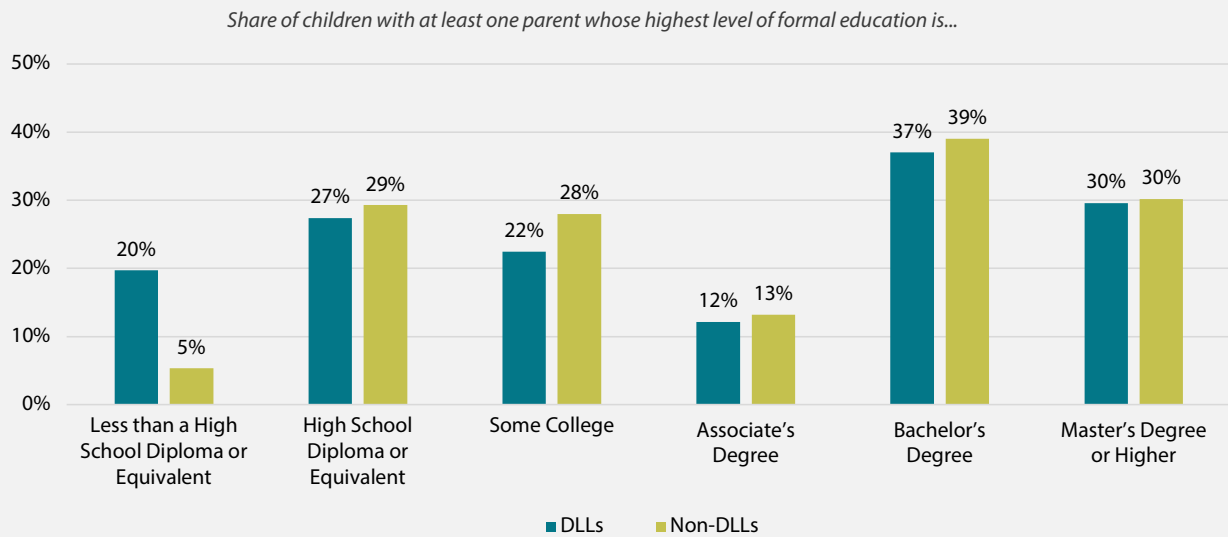

Notes: Languages spoken are self-reported in the American Community Survey (ACS). Shares may not add up to 100 percent due to rounding. “Chinese” includes Mandarin, Cantonese, and other Chinese languages.

DLLs comprise a strikingly disproportionate share of Virginia’s young children whose parents have a low level of formal education, making them a significant target for early childhood services.

- ▶ In 2019–23, 20 percent of the state’s DLLs had at least one parent whose highest level of education was less than a high school diploma or equivalent. This was the case for 5 percent of non-DLLs (see Figure 2).
- ▶ While DLLs comprised 27 percent of children ages 0 to 5 in Virginia, they comprised 57 percent of all children from this age group who had at least one parent whose highest level of education was less than a high school diploma or equivalent.
- ▶ An extensive body of research shows a correlation between parental educational attainment and a child’s academic achievement.⁸ ECEC program participation can therefore play a particularly important role in supporting the future educational success of DLLs whose parents have limited formal education.

FIGURE 2

Parental Education Levels of Children Ages 0 to 5 in Virginia, by DLL Status, 2019–23

DLLs living in low-income households are an important target for early childhood services.

- ▶ In 2019–23, 32 percent of Virginia’s DLL children resided in low-income households, as did 28 percent of non-DLL children (see Figure 3). These are households with an annual income below 200 percent of the federal poverty line.
- ▶ DLLs made up 29 percent of Virginia’s young children living in low-income households, similar to the DLL share of all children ages 0 to 5 (27 percent). Research shows that children experiencing poverty, particularly during the early years of their development, are at risk of negative cognitive, academic, social, health, and long-term economic outcomes.⁹ It also shows that high-quality ECEC programs

can help mitigate the adverse effects of child poverty by promoting cognitive, social, and emotional development.¹⁰

- ▶ Early childhood programs such as Head Start and Early Head Start prioritize enrolling children from low-income families, using the U.S. Department of Health and Human Services’ Poverty Guidelines and Section 645 of the *Head Start Act* to determine income eligibility for participation.¹¹ This focus on serving low-income families, coupled with DLLs’ disproportionate likelihood to live in a low-income household, makes these children a significant target population for such early childhood services.

Limited access to the internet and digital devices is a significant barrier that can keep some DLLs’ families from accessing early childhood services.

- ▶ In 2019–23, 3 percent of DLL children in Virginia lived in a household with no access to the internet, and 8 percent in a household with no access to a computer or laptop at home, as compared to 3 percent and 6 percent of the households of non-DLLs (see Figure 4). With limited digital access, it may be difficult for parents and caregivers to connect with early childhood programs and resources.
- ▶ DLLs made up 33 percent of all children ages 0 to 5 in Virginia whose households had no access to the internet, despite comprising 27 percent of the state’s children in this age group.

Limited health insurance coverage is another barrier that can hinder some DLLs’ access to important early childhood services.

- ▶ In 2019–23, DLL children in Virginia were more likely than non-DLLs to live in a household without health insurance (7 percent versus 3 percent), as shown in Figure 5.
- ▶ Without health insurance, parents may not have access to early childhood health services provided by pediatric physicians or have the opportunity to be referred to services such as early intervention (a system of services that support babies and toddlers up to age 3 with development delays or disabilities) or home visiting (a service delivery strategy in which a trained professional visits families in their homes to provide support, guidance, and resources).
- ▶ In Virginia, 60 percent of DLLs’ households had access to private health insurance, in comparison to 71 percent of non-DLLs’ households.

About the Authors

KATHERINE HABBEN

Katherine Habben is an Associate Policy Analyst at the Migration Policy Institute (MPI) National Center on Immigrant Integration Policy, where she focuses on early childhood education and care policies related to integration of immigrant-origin children. Prior to joining MPI, she worked as a researcher on the International Child Centered Curriculum Erasmus+ project, creating handbooks and materials for educators and international families to utilize during young children's transition into formal early childhood education and care. She is an experienced early childhood educator, working and training with several international and bilingual kindergartens in Berlin.

Ms. Habben holds a master's degree from Trinity College Dublin in social policy and practice with a comparative focus on early childhood education and care policy in Ireland and Germany, and a BA in philosophy from Western Illinois University.

VICTORIA KIM

Victoria Kim is a Research Assistant with MPI's National Center on Immigrant Integration Policy, where she focuses on early childhood and K-12 education issues, policies, and programs that affect children from immigrant and refugee families. Her focus areas include improving access to high-quality services, promoting meaningful engagement with parents, and addressing the specific needs of young Dual Language Learners (DLLs) and English Learner (EL) students. Before joining MPI, she was a Diane Bernstein Fellow in Child and Youth Advocacy with DC Action and worked with the DC Mayor's Office of Racial Equity.

Ms. Kim holds a master's degree in public policy and a BSEd in youth and social innovation and African and African American studies, both from the University of Virginia.

Acknowledgments

This fact sheet was produced with support from the Alliance for Early Success. It is part of a series of fact sheets on Dual Language Learners (DLLs) nationwide and in the 30 states with the most DLLs, which can be found on the Migration Policy Institute (MPI) website: www.migrationpolicy.org/research/data-profile-dual-language-learners. This is an update on a 2022 MPI fact sheet series authored by Ivana Tú Nhi Giang and Maki Park.

The authors thank their MPI colleagues for their assistance with this project, including Margie McHugh for her review and guidance, Jeanne Batalova for her analysis of the American Community Survey data included in this fact sheet, Andrés Villalba for their research support, Lauren Shaw for her editing expertise, and Michelle Mittelstadt for strategic outreach.
